

# Mark Scheme (Results)

January 2022

Pearson Edexcel International Advanced Level  
in Pure Mathematics P4 (WMA14)  
Paper 01

## **Edexcel and BTEC Qualifications**

Edexcel and BTEC qualifications are awarded by Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at [www.edexcel.com](http://www.edexcel.com) or [www.btec.co.uk](http://www.btec.co.uk). Alternatively, you can get in touch with us using the details on our contact us page at [www.edexcel.com/contactus](http://www.edexcel.com/contactus).

## **Pearson: helping people progress, everywhere**

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. Find out more about how we can help you and your students at: [www.pearson.com/uk](http://www.pearson.com/uk)

## General Marking Guidance

<https://britishstudentroom-b430a.web.app/>

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

## EDEXCEL IAL MATHEMATICS

### General Instructions for Marking

1. The total number of marks for the paper is 75.
2. The Edexcel Mathematics mark schemes use the following types of marks:
  - **M** marks: Method marks are awarded for ‘knowing a method and attempting to apply it’, unless otherwise indicated.
  - **A** marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
  - **B** marks are unconditional accuracy marks (independent of M marks)
  - Marks should not be subdivided.
3. Abbreviations

These are some of the traditional marking abbreviations that will appear in the mark schemes and can be used if you are using the annotation facility on ePEN.

- bod – benefit of doubt
- ft – follow through
- the symbol  $\checkmark$  will be used for correct ft
- cao – correct answer only
- cso - correct solution only. There must be no errors in this part of the question to obtain this mark
- isw – ignore subsequent working
- awrt – answers which round to
- SC: special case
- oe – or equivalent (and appropriate)
- d... or dep – dependent
- indep – independent
- dp decimal places
- sf significant figures
- \* The answer is printed on the paper or ag- answer given
- $\square$  or d... The second mark is dependent on gaining the first mark

4. All A marks are 'correct answer only' (cao.), unless shown, for example, as A1 ft to indicate that previous wrong working is to be followed through. After a misread however, the subsequent A marks affected are treated as A ft, but manifestly absurd answers should never be awarded A marks.
5. For misreading which does not alter the character of a question or materially simplify it, deduct two from any A or B marks gained, in that part of the question affected. If you are using the annotation facility on ePEN, indicate this action by 'MR' in the body of the script.
6. If a candidate makes more than one attempt at any question:
  - If all but one attempt is crossed out, mark the attempt which is NOT crossed out.
  - If either all attempts are crossed out or none are crossed out, mark all the attempts and score the highest single attempt.
7. Ignore wrong working or incorrect statements following a correct answer.

## General Principles for Pure Mathematics Marking

(But note that specific mark schemes may sometimes override these general principles)

### Method mark for solving 3 term quadratic:

#### 1. Factorisation

$(x^2 + bx + c) = (x + p)(x + q)$ , where  $|pq| = |c|$ , leading to  $x = \dots$

$(ax^2 + bx + c) = (mx + p)(nx + q)$ , where  $|pq| = |c|$  and  $|mn| = |a|$ , leading to  $x = \dots$

#### 2. Formula

Attempt to use correct formula (with values for  $a$ ,  $b$  and  $c$ ).

#### 3. Completing the square

Solving  $x^2 + bx + c = 0$ :  $(x \pm \frac{b}{2})^2 \pm q \pm c$ ,  $q \neq 0$ , leading to  $x = \dots$

### Method marks for differentiation and integration:

#### 1. Differentiation

Power of at least one term decreased by 1. ( $x^n \rightarrow x^{n-1}$ )

#### 2. Integration

Power of at least one term increased by 1. ( $x^n \rightarrow x^{n+1}$ )

### Use of a formula

Where a method involves using a formula that has been learnt, the advice given in recent examiners' reports is that the formula should be quoted first.

Normal marking procedure is as follows:

**Method mark** for quoting a correct formula and attempting to use it, even if there are small mistakes in the substitution of values.

Where the formula is not quoted, the method mark can be gained by implication from correct working with values, but may be lost if there is any mistake in the working.

### Exact answers

Examiners' reports have emphasised that where, for example, an exact answer is asked for, or working with surds is clearly required, marks will normally be lost if the candidate resorts to using rounded decimals.

### Answers without working

The rubric says that these may not gain full credit. Individual mark schemes will give details of what happens in particular cases. General policy is that if it could be done "in your head", detailed working would not be required. Most candidates do show working, but there are occasional awkward cases and if the mark scheme does not cover this, please contact your team leader for advice.

| Question | Scheme                                                                                                                                                                                                                                                                                                                                            | Marks |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1        | E.g $xy^2 \rightarrow (\dots +) 2xy \frac{dy}{dx}$ or $x^2y \rightarrow (\dots +) x^2 \frac{dy}{dx}$ but see notes.                                                                                                                                                                                                                               | M1    |
|          | $xy^2 \rightarrow y^2 + kxy \frac{dy}{dx}$ or $x^2y \rightarrow kxy + x^2 \frac{dy}{dx}$                                                                                                                                                                                                                                                          | dM1   |
|          | $y^2 + 2xy \frac{dy}{dx} = 2xy + x^2 \frac{dy}{dx}$ oe                                                                                                                                                                                                                                                                                            | A1    |
|          | $(x^2 - 2xy) \frac{dy}{dx} = y^2 - 2xy \Rightarrow \frac{dy}{dx} = \frac{y^2 - 2xy}{x^2 - 2xy} \Rightarrow \frac{dy}{dx} \Big _P = \frac{3^2 - 12}{2^2 - 12} = \dots$ or<br>$3^2 + 2 \times 2 \times 3 \frac{dy}{dx} \Big _P = 2 \times 2 \times 3 + 2^2 \frac{dy}{dx} \Big _P \Rightarrow \frac{dy}{dx} \Big _P = \frac{9 - 12}{4 - 12} = \dots$ | M1    |
|          | Tangent is $y - 3 = \frac{3}{8}(x - 2)$                                                                                                                                                                                                                                                                                                           | dM1   |
|          | $\Rightarrow 3x - 8y + 18 = 0$                                                                                                                                                                                                                                                                                                                    | A1    |
|          |                                                                                                                                                                                                                                                                                                                                                   | (6)   |

(6 marks)

**Notes:**

**M1:** For an attempt at implicit differentiation in some form. (Allow  $y'$  for  $\frac{dy}{dx}$ )

For the  $xy^2$  look for a term  $kxy \frac{dy}{dx}$  but condone  $ky \frac{dy}{dx}$

For the  $x^2y$  look for a term  $kx^2 \frac{dy}{dx}$  but condone  $kx \frac{dy}{dx}$

**dM1:** For attempting the product rule on either  $xy^2$  or  $x^2y$ .

Award for  $xy^2 \rightarrow y^2 + kxy \frac{dy}{dx}$  or  $x^2y \rightarrow kxy + x^2 \frac{dy}{dx}$

**A1:** For  $y^2 + 2xy \frac{dy}{dx} = 2xy + x^2 \frac{dy}{dx}$  or equivalent.

Ignore any spurious " $\frac{dy}{dx} =$ " in front of their equation.

**M1:** Attempts to find  $\frac{dy}{dx}$  at  $P$ . Must substitute **both**  $x$  and  $y$  values and rearrange (but can be done in

either order). Allow this mark as long as there are at least two terms in  $\frac{dy}{dx}$  in their

differentiation not including any spurious " $\frac{dy}{dx} =$ " There must be some correct substitution.

**dM1:** Uses their **non-zero**  $\frac{dy}{dx}$  at  $(2, 3)$  to find the equation of the tangent. **Depends on previous M.**

Look for  $y - 3 = "m"(x - 2)$  or  $y = "m"x + c$  where  $m$  is their attempt at the gradient at  $P$ , followed by attempt to find  $c$  using  $(2, 3)$  with the 2 and the 3 **positioned correctly**.

**A1:**  $3x - 8y + 18 = 0$  or any non-zero integer multiple of this equation but with all terms on one side.

| Question         | Scheme                                                                                                                                                               | Marks      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| <b>2(a)</b>      | $(1+4x^3)^{\frac{1}{3}} = 1 + \frac{1}{3}(\dots x^{\dots}) + \dots$                                                                                                  | <b>M1</b>  |
|                  | $(1+4x^3)^{\frac{1}{3}} = \dots + \frac{\frac{1}{3}(-\frac{2}{3})}{2}(4x^3)^2 + \dots$                                                                               | <b>M1</b>  |
|                  | $= 1 + \frac{4}{3}x^3 + \dots \text{ or } = \dots - \frac{16}{9}x^6$                                                                                                 | <b>A1</b>  |
|                  | $(1+4x^3)^{\frac{1}{3}} = 1 + \frac{4}{3}x^3 - \frac{16}{9}x^6 + \dots$                                                                                              | <b>A1</b>  |
|                  |                                                                                                                                                                      | <b>(4)</b> |
| <b>(b)</b>       | $1+4x^3 = 1 + 4 \times \left(\frac{1}{3}\right)^3 = \frac{31}{\dots} \text{ or } 1 + \frac{4}{3}\left(\frac{1}{3}\right)^3 - \frac{16}{9}\left(\frac{1}{3}\right)^6$ | <b>M1</b>  |
|                  | $\sqrt[3]{31} \approx 3 \times \left(1 + \frac{4}{3}\left(\frac{1}{3}\right)^3 - \frac{16}{9}\left(\frac{1}{3}\right)^6\right)$                                      | <b>dM1</b> |
|                  | $= \frac{6869}{2187}$                                                                                                                                                | <b>A1</b>  |
|                  |                                                                                                                                                                      | <b>(3)</b> |
| <b>(7 marks)</b> |                                                                                                                                                                      |            |

**Notes:**

**(a)**

**M1:** For  $1 \pm \frac{1}{3}(4x^{\dots})$ . Allow if the 4 and/or the power of  $x$  is incorrect/missing for this mark.

**M1:** For the correct structure for the third term. Look for the correct binomial coefficient combined with the correct power of  $4x^3$  e.g.  $\frac{\frac{1}{3}(\frac{1}{3}-1)}{2}(4x^3)^2$  but condone missing brackets e.g.  $\frac{\frac{1}{3}(\frac{1}{3}-1)}{2}4x^3^2$

**A1:** For  $1 + \frac{4}{3}x^3 + \dots$  **or** for  $\dots - \frac{16}{9}x^6$ .

Allow mixed fractions e.g.  $1\frac{1}{3}$  for  $\frac{4}{3}$  but do not allow '+-' for '-'.

**A1:** For  $1 + \frac{4}{3}x^3 - \frac{16}{9}x^6 + \dots$  **Ignore any extra terms.**

**(b)**

**M1:** Attempts  $1 + 4 \times \left(\frac{1}{3}\right)^3$  and reaches  $\frac{31}{k}$  (this will usually be seen as e.g.  $\sqrt[3]{\frac{31}{27}}$ ) **or** substitutes

$x = \frac{1}{3}$  into their expansion from part (a).

**dM1:** Attempts  $3 \times$  (their expansion from part (a) with  $x = \frac{1}{3}$  substituted)

**Allow if they have included more terms in their expansion for both M's. You need to be convinced that they have attempted this calculation and not just found the cube root of 31 on their calculator e.g. 3.1414...**

**A1:** Cao. Correct fraction.

| Question             | Scheme                                                                                                                          | Marks        |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------|--------------|
| <b>3(a)</b>          | $x = 3 + 2 \sin t \quad y = \frac{6}{7 + \cos 2t} \quad -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$                               |              |
|                      | $y = \frac{6}{7 + 1 - 2 \sin^2 t}$                                                                                              | <b>M1</b>    |
|                      | $\sin t = \frac{x-3}{2} \Rightarrow y = \frac{6}{8 - 2\left(\frac{x-3}{2}\right)^2}$                                            | <b>M1A1</b>  |
|                      | $\Rightarrow y = \frac{12}{16 - (x-3)^2} = \frac{12}{(4-x+3)(4+x-3)} = \frac{12}{(7-x)(1+x)}^*$                                 | <b>M1A1*</b> |
|                      | $\left( t = -\frac{\pi}{2} \Rightarrow x = 1, t = \frac{\pi}{2} \Rightarrow x = 5 \text{ so } \right) p = 1 \text{ and } q = 5$ | <b>B1</b>    |

**Notes:**

**(a)**

**M1:** Applies  $\cos 2t = \pm 1 \pm 2\sin^2 t$  to get  $y$  in terms of  $\sin t$ . This may be implied if they obtain  $\cos 2t$  in terms of  $x$  with no explicit sight of  $\sin t$ .

**M1:** Rearranges equation for  $x$  and substitutes into equation for  $y$ .

**A1:** Correct equation in terms of  $x$  and  $y$  only.

**M1:** Simplifies and factorises denominator (usual rules). May have the  $\frac{1}{2}$  left in the denominator, e.g.

$$y = \frac{6}{8 - \frac{1}{2}(x-3)^2} = \frac{6}{8 - \frac{1}{2}x^2 + 3x - \frac{9}{2}} = \frac{6}{-\frac{1}{2}x^2 + 3x + \frac{7}{2}} = \frac{6}{-\left(\frac{1}{2}x + \frac{1}{2}\right)(x-7)}$$

**A1\*:** Correct result reached with no errors seen.

**B1:** Correct values for  $p$  and  $q$  or correct inequality.

**Can score anywhere in their response but do not allow  $1 \leq t \leq 5$**

**(a) Way 2**

**M1:** Applies  $\cos 2t = \pm 1 \pm 2\sin^2 t$  to get  $y$  in terms of  $\sin t$

**M1:** Uses the difference of 2 squares in the denominator

**A1:** Correct equation with the square completed

**M1:** Substitutes for  $\sin t$  in terms of  $x$

**A1\*:** Correct result reached with no errors seen.

**B1:** Correct values for  $p$  and  $q$  or correct inequality. **Can score anywhere in their response.**

**(a) Way 3**

**M1:** Substitutes for  $x$  in terms of  $t$  into the given expression for  $y$

**M1:** Expands denominator.

**A1:** Correct expression.

**M1:** Applies  $\cos 2t = \pm 1 \pm 2\sin^2 t$  to get  $\sin^2 t$  in terms of  $\cos 2t$

**A1\*:** Correct result reached with no errors seen and minimal conclusion.

**B1:** Correct values for  $p$  and  $q$  or correct inequality. **Can score anywhere in their response.**

**(a) Way 4 (similar to Way 1)**

**M1:** Rearranges to get  $\cos 2t$  in terms of  $y$  and uses  $\cos 2t = \pm 1 \pm 2\sin^2 t$

**M1:** Rearranges equation for  $x$  and substitutes to obtain an equation in  $x$  and  $y$ .

**A1:** Correct equation in terms of  $x$  and  $y$  only.

**M1:** Simplifies and factorises denominator (usual rules).

**A1\*:** Correct result reached with no errors seen.

**B1:** Correct values for  $p$  and  $q$  or correct inequality. **Can score anywhere in their response.**

**(b)**

**M1:** Correct overall method to apply partial fractions to **the given fraction or equivalent correct fraction** and find at least one constant.

If no method is shown, one correct value can imply the method.

Score M0 for  $\frac{12}{(7-x)(1+x)} = \frac{A}{7-x} + \frac{B}{1+x} \Rightarrow 12 = A(7-x) + B(x+1) \Rightarrow A = \dots, B = \dots$

**A1:** At least one correct fraction in the required form e.g.

$$\frac{3}{2(1+x)}, -\frac{3}{2(x-7)} \text{ or e.g. } \frac{\frac{3}{2}}{1+x}, -\frac{\frac{6}{4}}{x-7} \text{ but not e.g. } \frac{3}{2x+2}, \frac{-3}{2x-14}$$

unless a correct form is seen beforehand.

**Or** a correct pair of values e.g.  $a = \frac{3}{2}, b = 1$  or  $c = \frac{3}{2}, d = 1$  or  $a = -\frac{3}{2}, b = -7$  or  $c = -\frac{3}{2}, d = -7$

**A1:** Correct expression for  $y$  in the given form  $\frac{3}{2(x+1)} - \frac{3}{2(x-7)}$  (there is no need for the " $y =$ ")

Accept as in scheme or any equivalents in the correct form, e.g. with 1.5 or equivalent as the numerators.

**Or** all values correct e.g.  $\left(a = \frac{3}{2}, b = 1 \text{ and } c = -\frac{3}{2}, d = -7\right)$  or  $\left(a = -\frac{3}{2}, b = -7 \text{ and } c = \frac{3}{2}, d = 1\right)$

**Note that in (b) some candidates may change the form of  $y$  first:**

$$\frac{12}{(7-x)(1+x)} = \frac{-12}{(x-7)(1+x)}$$

**In such cases the marks can be applied as in the scheme provided the expression is correct.**

| Question | Scheme                                                                                                                                                                                                   | Marks |

|          | awrt 0.019 (cm <sup>3</sup> s <sup>-1</sup> )                                                                                                                                                            | A1    |
|          |                                                                                                                                                                                                          | (3)   |

(8 marks)

#### Notes:

(a)

**M1:** Any correct method to establish a surd form for the area of one face. Must evaluate trigonometric terms.

Alternatives include e.g.  $\frac{1}{2} \times x \times \sqrt{x^2 - \left(\frac{1}{2}x\right)^2} = \frac{1}{2}x\sqrt{\frac{3}{4}x^2}$

**A1\*:** Correct result achieved after showing side area of one face.

#### Examples:

Area of one face  $= \frac{1}{2}x \times x \times \sin 60^\circ = \frac{1}{4}x^2\sqrt{3} \Rightarrow SA = 20 \times \frac{\sqrt{3}}{4}x^2 = 5\sqrt{3}x^2$  scores M1 A1

$SA = 20 \times \left(\frac{1}{2} \times x \times x \sin 60\right) = 5\sqrt{3}x^2$  scores M1 A0 for lack of working

(b)

**M1:** Attempts derivatives of both  $A$  and  $V$  wrt  $x$ . E.g.  $\left(\frac{dA}{dx} = \right)\alpha x$  and  $\left(\frac{dV}{dx} = \right)\beta x^2$ .

Note that  $\frac{5}{12}(3 + \sqrt{5})x^3$  is sometimes expanded first as e.g.  $\frac{5}{4}x^3 + \frac{5\sqrt{5}}{12}x^3$  and allow this mark

if either term is differentiated to  $\beta x^2$

**M1:** Applies the correct chain rule with their derivatives. (Condone poor notation – see below)

**A1\*:** Applies the chain rule to achieve the given result, with suitable intermediate step seen with  $\frac{dV}{dA} = \dots$  appearing somewhere in their solution.

Condone poor notation e.g. allow  $\frac{dA}{dt} = 10\sqrt{3}x$  and  $\frac{dV}{dt} = \frac{15}{12}(3 + \sqrt{5})x^2$ ,  $\frac{dV}{dA} = \frac{dV}{dt} \times \frac{dt}{dA}$  etc. for full marks.

Alt:

**M1:** Eliminates  $x$  from the two equations  $V = \frac{5}{12}(3 + \sqrt{5})\left(\frac{A}{5\sqrt{3}}\right)^{\frac{3}{2}}$

**M1:** Attempts to differentiate  $\frac{dV}{dA} = \frac{5}{12}(3 + \sqrt{5}) \times \frac{3}{2} \left(\frac{A}{5\sqrt{3}}\right)^{\frac{1}{2}} \times \frac{1}{5\sqrt{3}}$  – look for correct treatment of the  $5\sqrt{3}$  as well as correct power.

**A1:** Achieves correct result with no errors.

**(c)**

**B1:** Interprets the rate of change correctly to state or clearly imply by working that  $\frac{dA}{dt} = 0.025$

**M1:** Applies the chain rule appropriately **to find a value for**  $\frac{dV}{dt}$  using  $x = 2$

**A1:** awrt 0.019 condone lack of units.

| Notes:     |                                                                                                                                                                                                                                                                                                                                         |       |

(a)

**M1:** Attempts  $\frac{dx}{dt}$  achieving the form  $k(9-4t)^{-\frac{1}{2}}$  oe

**M1:** Applies the correct formula for the area,  $A = \int y \frac{dx}{dt} dt$ , with  $y$  and their  $\frac{dx}{dt}$

(no need for limits for this mark and no need for “dt”).

**ddM1:** Combines terms to a single fraction with one square root.

(no need for limits for this mark and no need for “dt”).

**Depends on both previous M marks.**

**A1:** Applies difference of squares, or expands, and deals with limits correctly to achieve correct result from correct working.

The “dt” must have made at least one appearance before the final line.

(b)

**B1:** Correct statement of  $\frac{du}{dt}$  or  $\frac{dt}{du}$  or any correct equation connecting  $du$  with  $dt$

**M1:** Complete substitution made into the integrand given in part (a) with their  $K$  or the letter  $K$  or a made up  $K$  e.g.  $K = 1$  to obtain an integral in terms of  $u$  only.

Don’t be concerned with the limits at this stage.

Condone the omission of the “du”.

**A1ft:** For any multiple of  $\int \left( 81u^{-\frac{1}{2}} - u^{\frac{1}{2}} \right) du$ . Limits are not needed.

Condone the omission of the “du”.

**M1:** Integrates an expression of the form  $ku^{-\frac{1}{2}} + lu^{\frac{1}{2}} \rightarrow Au^{\frac{1}{2}} + Bu^{\frac{3}{2}}$

**ddM1:** Applies correct limits to their integral either way round. Correct limits are 0 and 81 if

substituting into their integral in terms of  $u$  or 0 and  $\frac{9}{4}$  if reverting to  $t$ .

**Depends on all previous M marks.**

**A1:** Correct answer. Correct work leading to  $-\frac{243}{64}$  scores A0 but allow “hence area is  $\frac{243}{64}$ ”.

**Note that the question says “or otherwise” so some alternatives are:**

**Uses the substitution**  $u = \sqrt{81-16t^2}$  :

**B1:** Correct derivative statement  $\frac{du}{dt} = \frac{1}{2}(81-16t^2)^{-\frac{1}{2}} \times -32t$  oe such as  $2u du = -32t dt$

**M1A1ft:** Full substitution leading to  $2 \int \frac{81-u^2}{16u} \frac{2u}{-32} du = -\frac{1}{128} \int 81-u^2 du$

**ddM1:** Integrates to  $Ku - Lu^3$  **M1:** Applies correct limits 0 and 81 (or returns to  $t$ )

**Depends on all previous M marks.**

**A1:** Correct.

**Integration by parts:**

**B1:** For  $\int \frac{t}{\sqrt{81-16t^2}} dt = -\frac{1}{16} \sqrt{81-16t^2}$  seen or implied in working.

**M1A1ft:** Correct application of parts in the right direction

$$2 \int t^2 \times \frac{t}{\sqrt{81-16t^2}} dt = 2t^2 \times -\frac{1}{16} \sqrt{81-16t^2} - 2 \int 2t \times -\frac{1}{16} \sqrt{81-16t^2} dt$$

**M1:** Completes the integration process  $= -\frac{t^2}{8} \sqrt{81-16t^2} + \frac{1}{4} \times -\frac{\sqrt{81-16t^2}^3}{48}$

**ddM1:** Applies limits of 0 and  $\frac{9}{4}$ . **Depends on all previous M marks.**

**A1:** Correct answer.

| Question | Scheme                                                                                                                                                        | Marks      |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| 6        | Assume the sequence is geometric                                                                                                                              | <b>B1</b>  |
|          | So $(r =) \frac{1+2k}{k} = \frac{3+3k}{1+2k}$                                                                                                                 | <b>M1</b>  |
|          | $\Rightarrow (1+2k)^2 = k(3+3k) \Rightarrow k^2 + k + 1 = 0$                                                                                                  | <b>A1</b>  |
|          | But $k^2 + k + 1 = \left(k + \frac{1}{2}\right)^2 - \frac{1}{4} + 1 \geq \frac{3}{4} > 0$ (since $\left(k + \frac{1}{2}\right)^2 \geq 0$ for all (real) $k$ ) | <b>dM1</b> |
|          | This is a contradiction and hence the original assumption is not true.<br>The sequence is not geometric.                                                      | <b>A1</b>  |
|          |                                                                                                                                                               | <b>(5)</b> |

**(5 marks)**

**Notes:**

**(a)**

**B1:** States an appropriate assumption to set up the contradiction.

**M1:** Uses the assumption to set up an equation in  $k$  only.

Allow equivalent work e.g.  $kr = 1 + 2k$ ,  $kr^2 = 3 + 3k \Rightarrow 3 + 3k = k \left( \frac{1+2k}{k} \right)^2$

Allow use of  $\neq$  for  $=$  e.g.  $\sqrt{\frac{3+3k}{k}} \neq \frac{1+2k}{k}$

This may be implied by e.g.  $\frac{1+2k}{k}$  is not the same as  $\frac{3+3k}{1+2k}$ .

**A1:** Reaches a correct quadratic equation in  $k$ , need not be all on one side, but terms in  $k$  and  $k^2$  should be collected. Allow use of  $\neq$  for  $=$  e.g.  $k^2 + k + 1 \neq 0$

**dM1:** Completes the square, considers the discriminant or other valid means used to reach a point where a contradiction can be deduced. E.g. as scheme, or  $b^2 - 4ac = 1^2 - 4(1)(1) = -3 < 0$  may be used. Accept use of calculator to give roots  $k = \frac{-1 \pm i\sqrt{3}}{2}$  so  $k$  is not real, which contradicts  $k$  being a member of the real sequence.

**Depends on the previous M.**

**A1:** Correct work leading to a contradiction with deduction of a contradiction made and conclusion given. **This mark is available even if B0 is given at the start. So 01111 is possible.**

**If they are using the discriminant or calculator route then there is no need to mention “real” as long as they conclude that e.g. the geometric sequence is not possible. This can score both the dM1 and A1.**

| Question     | Scheme                                                                                                                                                                                                                                                                                                                                           | Marks    |

(8 marks)

**Notes:**

**(a)**

**M1:** Sets up the volume using the volume formula, but allow limits and  $\pi$  and the “dx” to be missing. No need to square  $f(x)$  for this mark as long as the intent to do so is clear.

There should be an integral

**M1:** Attempts to square  $f(x)$  (need not be part of an integral). The power of e should be correct and the bracket expanded, but allow if the  $\frac{1}{4}$  is not squared.

**A1:** Correct expression for the integral,  $\pi$  and limits must be included, and no errors seen in working so the “dx” must be present throughout.

**(b)**

**M1:** Attempts integration by parts the correct way at least once on the given integral to obtain

$$\alpha (x^2 - 8x + 16)e^{2x} \pm \beta \int (ax - b)e^{2x} dx$$

**A1:** Correct first application of parts:  $(x^2 - 8x + 16)\frac{e^{2x}}{2} - \int (2x - 8) \times \frac{e^{2x}}{2} dx$  or equivalent.

**dM1:** Attempts integration by parts again in the same direction on  $\int (2x - 8) \times \frac{e^{2x}}{2} dx$  and proceeds

to complete the integration. Look for  $K \left( \dots + \alpha (ax - b)e^{2x} \pm \beta \int e^{2x} dx \right)$ .

**ddM1:** Applies the limits to their integral and subtracts, (but this need not have the  $K$  or  $\pi$  for this mark.) May be done in stages, so look for reaching a value using correct limits on each part of their integral.

**A1:** Correct answer achieved from correct work and the  $\pi$  must have been introduced before the final step, it should have been part of their answer to (a). Condone lack of units.

**Way 2**

**M1:** Attempts integration by parts the correct way at least once on the given integral to obtain

$$\alpha(4-x)^2 e^{2x} \pm \beta \int (4-x) e^{2x} dx.$$

**A1:** Correct first application of parts:  $(4-x)^2 \frac{e^{2x}}{2} + \int (4-x) e^{2x} dx$  or equivalent.

**dM1:** Attempts integration by parts again in the same direction on  $\int (4-x) e^{2x} dx$  **and proceeds to complete the integration.** Look for  $K \left( \dots + \alpha(4-x) e^{2x} \pm \beta \int e^{2x} dx \right)$  for the parts.

**ddM1:** Applies the limits to their integral and subtracts, (but this need not have the  $K$  or  $\pi$  for this mark.) May be done in stages, so look for reaching a value using correct limits on each part of their integral.

**A1:** Correct answer achieved from correct work and the  $\pi$  must have been introduced before the final step, it should have been part of their answer to (a). Condone lack of units.

### Way 3

**M1:** Splits the integral and attempts integration by parts the correct way at least once on  $\int x^2 e^{2x} dx$ .

Look for  $\alpha x^2 e^{2x} \pm \beta \int x e^{2x} dx$ .

**A1:** Correct first application of parts:  $x^2 \frac{e^{2x}}{2} - \int 2x \frac{e^{2x}}{2} dx$  or equivalent.

**dM1:** Applies parts a second time on both occurrences of  $\int x e^{2x} dx$  and completes the integration.

**ddM1:** Applies the limits to their integral and subtracts, (but this need not have the  $K$  or  $\pi$  for this mark.) May be done in stages, so look for reaching a value using correct limits on each part of their integral.

**A1:** Correct answer achieved from correct work and the  $\pi$  must have been introduced before the final step, it should have been part of their answer to (a). Condone lack of units.

## Notes:

(a)

**M1:** Attempts the difference between the given two vectors. Implied by 2 out of three correct coordinates if no method is shown. Can be either way round.

**A1:** Any correct equation for the line in the form given and **must have** " $\mathbf{r} = \dots$ ". Two examples are shown in the scheme, but they may use any point on the line as the starting point, and any multiple of the direction vector.

Allow in  $\mathbf{i}, \mathbf{j}, \mathbf{k}$  form but not e.g.  $\mathbf{r} = \begin{pmatrix} 6\mathbf{i} \\ 6\mathbf{j} \\ 2\mathbf{k} \end{pmatrix} + \lambda \begin{pmatrix} 0 \\ -6\mathbf{j} \\ 5\mathbf{k} \end{pmatrix}$  but condone missing brackets on the position vector so

condone e.g.  $\mathbf{r} = 6 + \lambda \begin{pmatrix} 0 \\ -6 \\ 5 \end{pmatrix}$  but not on the direction so  $\mathbf{r} = \begin{pmatrix} 6 \\ 6 \\ 2 \end{pmatrix} + \lambda \begin{pmatrix} 0 \\ -6 \\ 5 \end{pmatrix}$  is A0

(b)

**M1:** Equates their line and the given line and extracts at least one equation in  $\lambda$  and  $\mu$

**A1:** "Correct" value for one parameter. This will depend on which equation(s) they solve – see main scheme **but must follow M1**.

**M1:** Substitutes into both other equations to compare results.

**A1:** Correct values for  $\lambda$  found with conclusion that the lines do not meet.

**Alt:** If equation 1 is not first used to find  $\mu$  then the 1<sup>st</sup> A mark can be awarded for any correct value for  $\lambda$  or  $\mu$  from the equations they solve, and the M mark for checking their solutions for consistency in the remaining equation.

**For the final A, all work must have been correct with a suitable conclusion made.**

**When checking, allow e.g.  $2 - \frac{25}{3} \neq 4 + 27$  so they do not meet. I.e. the calculations may not be fully carried out as long as the result is obvious. However if either side is subsequently evaluated incorrectly, withhold the final mark.**

FYI: equations (1) and (2) give  $\lambda = -\frac{5}{3}$  or  $\mu = 3$ ; equations (1) and (3) give  $\lambda = \frac{29}{5}$  or  $\mu = 3$  and

equations (2) and (3) give  $\lambda = \frac{55}{79}$  or  $\mu = \frac{13}{79}$  (use of the negative direction vectors reverse the signs of  $\lambda$ s)

If  $\mathbf{r} = \begin{pmatrix} 6 \\ 0 \\ 7 \end{pmatrix} + \lambda \begin{pmatrix} 0 \\ 6 \\ -5 \end{pmatrix}$  is used equations (1) and (2) give  $\lambda = \frac{8}{3}$  or  $\mu = 3$ ; equations (1) and (3) give  $\lambda = -\frac{24}{5}$

or  $\mu = 3$  and equations (2) and (3) give  $\lambda = \frac{24}{79}$  or  $\mu = \frac{13}{79}$  (use of the negative direction vectors reverse the signs of  $\lambda$ s)

**Note that the maximum marks in (b) if their line in (a) is incorrect is 1010**

**There will be many different approaches to part (b).**

**The general structure for marking is as follows:**

**M1:** Equates lines and obtains at least one equation in  $\lambda$  and  $\mu$

**A1:** Correct value for one of the parameters

**M1:** Attempts the checking process to show the lines do not meet

**A1:** All correct with a conclusion

**(c)**

**M1:** Substitutes  $\mu = -1$  into  $l_2$  to find the coordinates for  $C$  or the vector  $\overrightarrow{OC}$

**dM1:** Uses their  $\overrightarrow{OC}$  to find  $\pm \overrightarrow{AC}$ . Look for an attempt at the difference of vectors with at least two correct coordinates.

**ddM1:** Attempts  $\frac{\pm \overrightarrow{AC} \cdot (\mathbf{i} + 5\mathbf{j} + 9\mathbf{k})}{|\overrightarrow{AC}| |\mathbf{i} + 5\mathbf{j} + 9\mathbf{k}|}$  with their  $\overrightarrow{AC}$

This requires an attempt at the scalar product of their  $\overrightarrow{AC}$  with  $\mathbf{i} + 5\mathbf{j} + 9\mathbf{k}$  in the numerator with at least 2 “components” correct if no method is shown, and correct attempts at the product of the magnitudes of  $\overrightarrow{AC}$  and the direction of  $\mathbf{i} + 5\mathbf{j} + 9\mathbf{k}$  in the denominator.

**A1:** A correct expression simplified or unsimplified e.g.  $\pm \left( \frac{-4 \times 1 + -10 \times 5 + -7 \times 9}{\sqrt{16 + 100 + 49} \sqrt{1 + 25 + 81}} \right)$ ,  $\pm \frac{117}{\sqrt{17655}}$

**A1:** Correct answer. Accept awrt 28.3

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                       | (5)   |

**Notes:****(a)**

**M1:** Differentiates to achieve the form  $\frac{K}{y(1+2\ln y)^3}$ .

You can ignore what they call it so just look for the expression.

**A1:** Correct derivative, accept any equivalent form, need not be simplified.

You can ignore what they call it so just look for the expression.

**(b)**

**M1:** Attempts to separate the variables with one side correct ignoring coefficients and with at least

one side integrated to the correct form. The separation may have  $\frac{k}{\operatorname{cosec} 2x}$  rather than  $k \sin 2x$ .

Do not be concerned about the presence or absence of the “dx” and “dy” or even if they are wrongly position – just look for the expressions appearing on either side.

**M1:** Attempt to separate the variables with both sides correct ignoring coefficients and with both

sides integrated to the correct form. The separation may have  $\frac{k}{\operatorname{cosec} 2x}$  rather than  $k \sin 2x$ .

Do not be concerned about the presence or absence of the “dx” and “dy” or even if they are wrongly position – just look for the expressions appearing on either side.

**A1:** One side integrated **correctly**.

For the LHS this will be either  $-\frac{1}{4(1+2\ln y)^2}$  or  $-\frac{3}{4(1+2\ln y)^2}$

For the RHS this will be either  $-\frac{1}{2}\cos(2x)$  or  $-\frac{1}{6}\cos(2x)$  but note that if  $\sin 2x$  is changed to

$2\sin x \cos x$  first, the integration may appear as e.g.  $\frac{1}{3}\sin^2 x$  or  $-\frac{1}{3}\cos^2 x$  or  $\sin^2 x$  or  $-\cos^2 x$

**A1:** A **fully correct** general solution, need not be simplified and a constant of integration is not required.

**Note that M1M0A1A0 is possible as a mark profile.**

**(c)**

**Note that if a candidate rearranges to an explicit form in part (b) the work can be credited in part (c) but there is no credit for work for part (c) in part (b) unless part (c) is attempted.**

**M1:** Substitutes the boundary values into their equation to find their constant which does not to be evaluated for this mark.

This may be done later in the solution, but they must have a constant in the equation.

**A1:** Correct equation in any form with their constant evaluated. **Must follow A1 in (b).**

**M1:** Applies  $\cos 2x = \pm 2\cos^2 x \pm 1$  at some point in their solution.

May see attempts to rearrange to  $y = \dots$  first **and note that if candidates integrate the  $\sin 2x$  in part (b) to  $\dots\cos^2 x$  then they can score this mark by implication if part (c) is attempted.**

**ddM1:** Rearranges the equation, **including square rooting**, to reach  $\ln y = \dots$

**Depends on both previous method marks.**

**A1:** Correct answer achieved.

**You may see candidates rearrange first in (b) to achieve e.g.**

$$C - \frac{3}{4(1+2\ln y)^2} = -\frac{1}{2}\cos(2x) \Rightarrow C + \frac{1}{2}\cos(2x) = \frac{3}{4(1+2\ln y)^2} \Rightarrow (1+2\ln y)^2 = \frac{3}{4C+2\cos(2x)}$$
$$\Rightarrow \ln y = \frac{1}{2}\sqrt{\frac{3}{4C+2\cos(2x)}} - \frac{1}{2} \Rightarrow y = \exp\left(\frac{1}{2}\sqrt{\frac{3}{4C+2\cos(2x)}} - \frac{1}{2}\right)$$

The first M in (c) will be scored when they substitute the given conditions into their rearranged equation that contains a constant and the first A mark for a correct equation. They will also score the second M if they use the double angle formula. The dM mark will be as described e.g. Rearranges the equation, **including square rooting**, to reach  $\ln y = \dots$  and **depends on both previous method marks**.

**There are no marks in (c) for substituting the initial conditions into the given answer to find the value of A. If you see any attempts to use this answer to show it satisfies the differential equation in (b) let your TL know.**
