| You must have: Mathematical Formulae and Stat | istical ⁻ | Γables (Pir | nk) | Total Marks |

Candidates may use any calculator permitted by Pearson regulations. Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulae stored in them.

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B). Coloured pencils and highlighter pens must not be used.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided
 there may be more space than you need.
- You should show sufficient working to make your methods clear. Answers without working may not gain full credit.
- Whenever a numerical value of g is required, take g = 9.8 m s⁻², and give your answer to either two significant figures or three significant figures.
- When a calculator is used, the answer should be given to an appropriate degree of accuracy.

Information

- The total mark for this paper is 75.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

4.

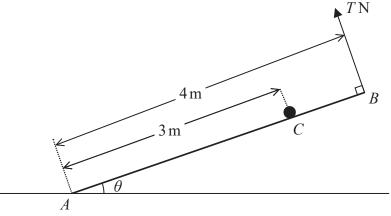

Figure 1

A uniform rod AB, of weight 50 N and length 4 m, rests with one end A on rough horizontal ground. A particle of weight 10 N is attached to the rod at C, where AC = 3 m. The rod is

held in limiting equilibrium at an angle θ to the horizontal, where $\tan \theta = \frac{5}{12}$, by a force

of magnitude T newtons. This force acts in a direction perpendicular to the rod at B, as shown in Figure 1. The line of action of the force lies in the same vertical plane as the rod. The coefficient of friction between the ground and the rod is μ .

Find

(a) the value of T,

(3)

(b) the value of μ .

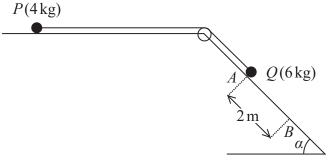

Figure 2

Two particles, P and Q, of masses 4kg and 6kg respectively, are connected by a light inextensible string. The string passes over a small smooth pulley which is fixed at a point on the line of intersection of a fixed rough horizontal plane and a fixed smooth inclined plane. The string lies in a vertical plane that contains a line of greatest slope of the inclined plane. The inclined plane is at an angle α to the horizontal, where $\tan \alpha = 2$. The particles are held at rest, with the string taut, so that P is on the horizontal plane and Q is at the point A on the inclined plane. The point B, which is on the line of greatest slope of the plane through A, is 2 m down the plane from A, as shown in Figure 2.

The particles are released from rest and Q moves down the inclined plane. At the instant when Q is at B, the speed of Q is $3 \,\mathrm{m \, s^{-1}}$ and P has not reached the pulley.

(a) Find the kinetic energy gained by the system as Q moves from A to B.

(2)

(b) Using the work-energy principle, find the coefficient of friction between P and the horizontal plane.

| | (Total o marks) | |

Two particles, A and B, of masses 2m and 3m respectively, lie on a smooth horizontal surface. Particle B lies between particle A and a fixed smooth vertical wall. The particles are set in motion in the same direction, along the same straight line, towards the wall. The speed of A is u and the speed of B is 2u. Particle B hits the wall, which is perpendicular to the direction of motion of the particles. Particle B rebounds and there is then a direct collision between A and B. The coefficient of restitution between B and the wall is e.

The coefficient of restitution between A and B is $\frac{1}{3}$.

In the collision between A and B, the directions of motion of both particles are reversed.

Find the range of possible values for e

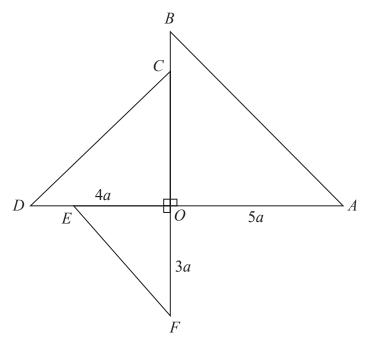

Figure 3

The uniform plane lamina L, shown in Figure 3, is made from three right-angled isosceles triangles, OAB, OCD and OEF, all of the same material. The triangles have sides OA = OB = 5a, OC = OD = 4a and OE = OF = 3a. The point C lies on OB and the point E lies on OD.

(a) Show that the centre of mass of L is
$$\frac{27}{25}a$$
 from AD. (5)

The lamina L is freely suspended from A and hangs in equilibrium.

(b) Find the size of the angle between AD and the downward vertical.

(7)

The mass of L is 50M. A particle of mass kM is attached to L at the point F so that, when L is suspended from A, the line AD is vertical.

(c) Find the value of k.
